

From the beginning of the class, the genre of game puzzled us the most. After some time we settled on making a tower defense game similar to Arknights or Balloons tower defense. Like last time I was responsible for making the UI and the narrative. We decided to introduce a mechanic where the perspective and spawn points change every wave, as a way of meeting the theme. Going into this final game, I didn't initially know what I wanted to do in terms of story, so I decided to extend the Alt hospital to be one more part. I did know what I wanted to do for the ending. The ending has the protagonist and the rest of the participants escaping to the real world, and saving Nova, sacrificing Luna in the process.

I would say out of all of the games we have made so far, this one was the easiest in my opinion. A lot of systems were carried over with small changes. For example the dialog system only needed 1 change to work with this game, that being a connection to the wave spawner so it can trigger cutscenes. Another factor for lack of difficulty when it came to creating this game was our familiarity with the engine. With the dungeon crawler being most of the team's first experience using Unity engine, We found it difficult to use and set up stuff. By now we have mastered unity's system, and work with ease using it.

Overall, I think this was our most polished game of the four. But I would say that the second game was my favorite. I'm biased in that I always wanted to make a dungeon crawler RPG. but this one is definitely my second favorite.

Overall I really enjoyed the Semester long 4 game project. I worked with some amazing people, and we achieved a lot, in a short amount of time. I will take this experience with me for my entire career
