

CSC 591 Resource Management Reflection

Devin Pinyard

For the Resource Management game, I worked on a different facet of the game development than for the previous games. In both of the last games, I was the sole designer of the environment and worked with the architectural design and generation of all aspects of both games. For this game, I instead opted to work on more of the primary interactive mechanics—specifically, the tower design and the interface for their interaction with the enemies and UI.

During this project, I was allowed to work with a lot more of the interactive code between different parts of the game. In both of the last ones, as long as I finished my part, I could kind of ignore interactions just because that is how the environment typically functions. For this one, instead, I had to communicate more with my teammates and provide more methods for interactions, as both the UI and enemy design are intertwined heavily.

We were able to reuse some more of the sprite assets for this game, which helped to streamline our development process and spend more time with the code and fine-tuning than working with sprite and prop production.

We used the metamorphosis of the towers/characters in this game to emphasize our theme. This is similar to how it was in the original dungeon crawler game because it is just the level of the characters represented by the towers. This is furthered by the absurdity of having multiple characters potentially concurrently present in the environment. Separately, we also changed the perspective of the camera and orientation of how enemies entered the environment every wave—also developing our theme of metamorphosis and absurdism, changing the environment, which we have done to some capacity in every game so far. Narratively, we're still stuck in the hospital, which helps to emphasize the feeling of stasis in the metamorphosis we are

still going for. The characters keep working towards escape, but just end up in the same position yet again.

The final quality of this game is a lot better than the other games we have worked on so far. There is still a long way to go before I would be happy publishing this game, but of what has been done so far, I think the quality of the game far surpasses what our group has done in the past, and I am grateful for all of the skills my team and I have developed together and turned toward an eventual, really good project I am happy to submit.
